Driving style identification / driver’s control strategy

• Motivation:
  Driver-specific adjustment of systems and functions in the vehicle
  What is a useful driver adjustment?
  Identification of typical driver groups and specification of essential distinguishing features

• Problem:
  What are the driver’s individual characteristics, e.g. driving style, driving strategy and individual experience?
  Which characteristics are similar among the drivers and how can these criteria be identified online in the vehicle?

• Objective:
  Provision of useful driver information for the adjustment derived from individual driving behaviour and assistance specifications

• Solution:
  Identification of the individual driver behaviour by means of driver models and defined parameters as well as comparison to reference values
  Determination of the individual assistance specification by identifying group-specific control features
